Here's a reworded version of the answers:

Q1: The existing tariff plans offered by Telecom Service Providers (TSPs) do not adequately cater to the needs and preferences of elderly individuals. Since many seniors use feature phones that don't support internet or apps, they don't benefit from bundled plans that include data services and other features. Instead, they require affordable voice-only plans that focus solely on making and receiving calls. Unfortunately, such plans are scarce in the current market, leaving elderly users with limited options that don't fully meet their requirements.

Q2: There is a significant demand for voice-only packs in the current telecom market. Given the specific needs of elderly users and others who primarily use their phones for voice calls, it's essential for TSPs to offer at least one voice-only plan that caters to this demographic. This would ensure that their needs are met, and they're not forced to pay for unnecessary features.

Regards,
